Learning Outcomes Addressed

- Understand how AI, GenAI and Agentic AI work and where they apply in business.
- Use prompts effectively for analysis, decision-making and content generation.
- Map business workflows and identify where AI can drive automation and efficiency.
- Evaluate AI opportunities using feasibility, ROI and impact criteria.
- Build AI adoption roadmaps aligned to business goals and KPIs.
- Apply data governance, privacy and ethical AI principles.

Phase 6 – Future and Synthesis

Milestone 13: 3-Year AI Capability Roadmap

Estimated Effort: 1.5 Hours

Objective

AI initiatives rarely remain static after initial deployment.

Most successful AI systems evolve gradually as organisations gain experience with:

- operational workflows
- user adoption
- data infrastructure
- AI governance and monitoring

Early deployments often begin with **limited pilot implementations**, which allow organisations to test performance and validate value.

Once the system demonstrates clear benefits, organisations move towards **scaled deployment across teams, departments, or geographic regions**.

Over time, AI capabilities may expand further to include **greater autonomy, advanced analytics, and multimodal interactions**.

In this module, you will design a **3-Year AI Capability Roadmap** that describes how the AI solution developed in your capstone project could evolve over time.

How This Connects to Earlier Modules

In earlier modules, you designed:

- the AI-enabled workflow
- agent architecture and governance
- strategic validation and investment decisions
- enterprise deployment architecture
- governance and risk controls

These steps focused on **launching and managing an AI solution today**.

In this module, you will consider a broader question:

How might this AI capability evolve over the next three years?

This roadmap helps organisations plan **long-term AI maturity and capability development**.

Note: This is a required assignment and counts towards programme completion.

Task Overview

Design a **3-Year AI Capability Roadmap** for your AI solution.

Your roadmap should describe how the system evolves across **three phases of adoption**:

1. **Phase 1 – Pilot Implementation**
2. **Phase 2 – Scaled Deployment**
3. **Phase 3 – Autonomous Expansion**

You should also describe **future AI capability enhancements**, such as:

- multimodal AI capabilities
- predictive analytics features
- advanced autonomous agents
- cross-workflow integration

The roadmap should demonstrate how your AI system progresses from **initial deployment to more advanced and intelligent capabilities**.

Step 1 — Phase 1: Pilot Implementation

The first phase focuses on **testing the AI solution in a controlled environment**.

The goal is to validate that the AI system:

- performs the intended workflow tasks effectively
- integrates with existing systems
- delivers measurable operational benefits

Pilot implementations typically involve:

- a limited number of users or teams
- controlled operational environments
- close human oversight and monitoring

Example (Illustrative)

Pilot Objective	Example Implementation
Test AI workflow	Deploy AI support assistant within one customer support team
Monitor performance	Track response accuracy and processing time

Pilot Objective	Example Implementation
Validate ROI assumptions	Compare operational efficiency before and after AI adoption

The pilot phase helps organisations **identify technical issues and operational adjustments before scaling the system.**

Step 2 — Phase 2: Scaled Deployment

Once the pilot demonstrates clear value, the AI system can be **expanded across the organisation.**

Scaled deployment focuses on:

- increasing the number of users or departments using the system
- integrating the AI workflow into standard operational processes
- improving system reliability and performance

Organisations may also enhance the system with:

- improved automation capabilities
- expanded data sources
- refined monitoring and governance frameworks

Example (Illustrative)

Scaling Objective	Example Implementation
Expand usage	Deploy AI support assistant across all customer service teams
Improve integration	Integrate AI with CRM and analytics platforms
Increase automation	Enable automated handling of common enquiries

The goal of this phase is to ensure that the AI solution becomes a **stable and widely adopted operational capability.**

Step 3 — Phase 3: Autonomous Expansion

In the third phase, organisations may expand the AI system towards **greater autonomy and intelligence.**

This stage focuses on:

- reducing manual oversight
- expanding agent decision-making capabilities

- integrating AI across multiple workflows

AI systems may evolve into **agentic ecosystems**, where multiple agents coordinate tasks across organisational processes.

Example (Illustrative)

Expansion Objective	Example Implementation
Increase autonomy	AI agent independently resolves common customer issues
Cross-system coordination	AI interacts with billing and logistics systems
Decision assistance	AI recommends operational actions based on data analysis

At this stage, AI becomes a **core operational capability within the organisation**.

Step 4 — Identify Future AI Capability Enhancements

Beyond the three deployment phases, organisations may explore **advanced AI capabilities** that further enhance system performance.

You should briefly describe potential **future enhancements** relevant to your AI solution.

Possible areas include:

Multimodal AI

Multimodal systems can process **multiple forms of input**, such as text, images, audio, or video.

Example:

Customer support AI that analyses both written queries and uploaded product images.

Predictive Analytics

AI systems may incorporate **predictive models** that forecast future outcomes.

Example:

AI predicting customer support demand and recommending staffing adjustments.

Advanced Autonomous Agents

Future AI systems may include **more sophisticated agents** capable of coordinating complex tasks.

Example:

AI agents that autonomously manage multiple stages of an operational workflow.

Cross-Workflow Integration

AI capabilities may expand to connect **multiple business processes**.

Example:

An AI system that links customer support insights with product development feedback.

Required Output Structure

Your **3-Year AI Capability Roadmap** should include:

1. Phase 1 – Pilot Implementation

Description of how the AI system is initially tested and validated.

2. Phase 2 – Scaled Deployment

Explanation of how the system expands across the organisation.

3. Phase 3 – Autonomous Expansion

Description of how the system evolves towards greater autonomy and intelligence.

4. Future Capability Enhancements

Discussion of potential advanced AI capabilities such as multimodal systems, predictive analytics, or advanced agents.

Practical Tips

Keep the Roadmap Realistic

Your roadmap should reflect **practical organisational constraints**, such as adoption timelines, system integration, and governance requirements.

Build on Your Existing Solution

Your roadmap should clearly extend the **AI system you designed earlier in the capstone project**.

Think in Terms of Capability Maturity

AI capabilities typically evolve gradually as organisations develop:

- stronger data infrastructure
 - improved governance frameworks
 - greater operational confidence in AI systems
-

Avoid These Common Mistakes

- ✗ Proposing unrealistic technological leaps within a short timeframe
- ✗ Ignoring operational constraints and adoption challenges
- ✗ Describing future technologies without connecting them to your existing solution
- ✗ Failing to explain how the system evolves over time

Effective roadmaps demonstrate **a clear progression from pilot experimentation to advanced AI capabilities**.

Submission

Before submitting your **3-Year AI Capability Roadmap**, confirm that you have included:

- ✓ Phase 1 – Pilot implementation plan
- ✓ Phase 2 – Scaled deployment strategy
- ✓ Phase 3 – Autonomous expansion vision
- ✓ Future AI capability enhancements

Instructions:

- Use the same document that you downloaded in Module 1 and include your responses.
- We recommend you add additional text boxes or slides (if needed) for each milestone task to ensure that your responses are documented in a proper format.
- The document will gradually grow as you complete each capstone milestone. The final submission occurs at the end of Module 14.

Grading Rubric

Maximum Points: 15

Criteria	Full Points	0 Points
Phase 1 – Pilot Implementation (4 points)	The submission describes the pilot implementation of the AI solution. (4 points)	The pilot implementation is missing. (0 points)
Phase 2 – Scaled Deployment (4 points)	The submission describes how the AI solution will be scaled across the organisation. (4 points)	The scaled deployment strategy is missing. (0 points)
Phase 3 – Autonomous Expansion (4 points)	The submission describes how the AI solution can evolve towards greater autonomy and intelligence. (4 points)	The autonomous expansion plan is missing. (0 points)
Future AI Capability Enhancements (3 points)	The submission identifies future AI capabilities that could enhance the solution. (3 points)	The future AI capability enhancements are missing. (0 points)

Why this Step Matters

AI adoption is not a one-time project — it is an **ongoing capability development journey**.

Organisations that successfully scale AI often follow a progression:

1. **Pilot experimentation**
2. **Operational deployment**
3. **Expanded autonomy and intelligent automation**

Developing a roadmap helps organisations ensure that their AI initiatives remain **adaptable, forward-looking, and aligned with emerging technological capabilities**.

In the final module, you will bring together all elements of your work into a **complete AI solution synthesis and executive capstone presentation**.
