Learning Outcomes Addressed

- Understand how AI, GenAI and Agentic AI work and where they apply in business.
- Use prompts effectively for analysis, decision-making and content generation.
- Map business workflows and identify where AI can drive automation and efficiency.
- Evaluate AI opportunities using feasibility, ROI and impact criteria.
- Build AI adoption roadmaps aligned to business goals and KPIs.
- Apply data governance, privacy and ethical AI principles.

Phase 1 – Problem Framing and Generative AI Foundations

Milestone 2: Workflow Baseline and Risk Canvas

Estimated Effort: 1 Hour

Word Limit: 1000 words

Objective

In the previous module, you identified a business workflow and created an **AI Opportunity Brief**.

In this module, you will analyse that workflow in greater detail by documenting **how the process currently operates**.

You will create a **Workflow Baseline and Risk Canvas**, which maps:

- the current workflow structure
- areas of manual effort and inefficiency
- opportunities where Generative AI could assist
- potential risks and limitations associated with AI use

This baseline analysis is important because **effective AI solutions depend on a clear understanding of the existing process**.

The canvas you develop in this module will serve as a **foundation for later milestones**, where you will redesign the workflow using Generative AI and Agentic AI systems.

Note: This is a required assignment and counts towards programme completion.

Task Overview

Complete the following three steps using the **workflow you selected in Module 1**.

Step 1 – Document the Current Workflow

Start by mapping the **current workflow process**.

Identify the main steps involved in completing the workflow and the people or systems responsible for each step.

You may describe the workflow using:

- a simple numbered list
- a flow diagram
- a table of steps

Focus on documenting the **actual or current operational process**, not an ideal version of it.

Step 2 – Identify Manual Effort and Bottlenecks

Next, analyse the workflow and identify areas where:

- work is performed manually
- delays frequently occur
- repetitive information processing is required
- employees must review large amounts of text or data

These points often represent **high-potential areas for Generative AI assistance**.

Examples of bottlenecks include:

- manual document review
 - repetitive report preparation
 - slow approval cycles
 - searching across multiple documents for information
-

Step 3 – Identify AI Opportunities and Risks

Finally, identify where **Generative AI could potentially generate outputs or assist decision-making**.

Consider where AI could:

- summarise documents
- extract information from text
- draft responses or reports
- analyse patterns across data sources

At the same time, identify **risks and limitations** that may arise when using AI systems in this workflow.

Understanding these risks early helps ensure that future AI designs remain **responsible and reliable**.

Required Sections

Your **Workflow Baseline and Risk Canvas** should include the following components.

1. Current Workflow Steps

Describe the key steps involved in the existing workflow.

Include:

- the sequence of activities
- who performs them
- any tools or systems used

Example:

1. Vendor submits invoice
 2. Finance team reviews invoice details
 3. Data is entered into accounting software
 4. Manager reviews and approves payment
 5. Finance reconciles invoice with purchase order
-

2. Manual vs Automated Tasks

Identify which steps are currently:

- **Manual** – performed entirely by employees
- **Partially automated** – supported by existing software
- **Fully automated** – handled automatically by systems

Example:

Workflow Step	Manual / Automated
Invoice review	Manual
Data entry	Manual
Payment approval routing	Partially automated
Reconciliation	Manual

This analysis helps identify **where AI could provide the greatest operational value.**

3. Workflow Bottlenecks

Highlight the steps that create delays or inefficiencies.

Examples:

- manual data entry
- repetitive document review
- slow approval cycles
- searching across multiple systems for information

Example:

Invoice validation takes significant time because employees must manually verify information across multiple documents.

4. Baseline Workflow Metrics

Estimate the current performance of the workflow.

Possible metrics include:

- **cycle time** – how long the workflow takes to complete
- **processing cost** – approximate cost per task
- **error rates** – frequency of mistakes or corrections

Example:

- Average processing time per invoice: **10 minutes**
- Monthly volume: **1,500 invoices**
- Error rate: **2–3% requiring manual correction**

Precise numbers are not required; reasonable estimates are sufficient.

5. Expected Generative AI Outputs

Identify where Generative AI could generate useful outputs in the workflow.

Examples include:

- summarised documents
- extracted data from text files
- drafted reports or communications
- structured insights from unstructured data

Example:

AI could extract invoice details, generate validation summaries and draft approval notes for managers.

6. AI Limitations and Risks

Generative AI systems have limitations that must be considered when applying them in business workflows.

Common risks include:

- **Hallucination** – generating incorrect information
- **Bias** – skewed outputs due to training data
- **Lack of explainability** – difficulty understanding how outputs were generated
- **Data privacy concerns** – handling sensitive organisational information

Example:

AI-generated invoice summaries must be reviewed by employees to prevent errors caused by incorrect data extraction.

Practical Tips

Structure Your Canvas Clearly

- ✓ Use **simple tables or flow diagrams (if applicable)**
 - ✓ Focus on **clarity rather than complexity**
 - ✓ Keep the document within **1–2 pages**
-

Estimate Metrics Realistically

- ✓ Use rough but reasonable estimates
- ✓ Focus on the **relative scale of inefficiencies**

Even approximate metrics help demonstrate **where AI could create value.**

Identify Where AI Produces Outputs

Generative AI is most valuable when it produces **text, summaries, reports or structured information.**

Look for steps where employees must:

- read large documents
- analyse multiple information sources
- draft repetitive communications
- generate reports or summaries

These are often **ideal opportunities for Generative AI assistance.**

Example Scenario

Workflow

Finance team processes vendor invoices.

Current Workflow Issues

- manual data extraction from invoices
- slow validation process
- repetitive document comparison

Potential Generative AI Outputs

AI could:

- extract invoice details automatically
- summarise invoice information for approval
- highlight potential discrepancies for review

Possible Risks

- incorrect data extraction from complex invoice formats
- hallucinated summaries if source documents are unclear

Human review would still be required to **validate AI outputs**.

Submission

Before submitting your canvas, confirm that you have included:

- ✓ Current workflow steps
- ✓ Manual vs automated task identification
- ✓ Workflow bottlenecks
- ✓ Baseline metrics (time, cost or error estimates)
- ✓ Expected Generative AI outputs
- ✓ Key AI limitations and risks

Instructions:

- Use the same document that you downloaded in Module 1 and include your responses.
- We recommend you add additional text boxes or slides (if needed) for each milestone task to ensure that your responses are documented in a proper format.
- The document will gradually grow as you complete each capstone milestone. The final submission occurs at the end of Module 14.

Grading Rubric

Maximum Points: 15

Criteria	Full Points	0 Points
Current Workflow Steps	The submission includes the current workflow steps in sequence. (2 points)	Current workflow steps are missing. (0 points)
Manual vs Automated Task Identification	The submission identifies which tasks are manual and which are automated. (2 points)	Manual vs automated tasks are not identified. (0 points)
Workflow Bottlenecks	The submission identifies key bottlenecks or inefficiencies in the workflow with reasonable explanation. (2 points)	Workflow bottlenecks are missing. (0 points)
Baseline Metrics	The submission includes baseline estimates such as time, cost or error rates. (3 points)	Baseline metrics are missing. (0 points)
Expected Generative AI Outputs	The submission defines the expected outputs from Generative AI within the workflow. (3 points)	Expected Generative AI outputs are missing. (0 points)
AI Limitations and Risks	The submission identifies key limitations and risks of using Generative AI. (3 points)	AI limitations and risks are missing. (0 points)

Why this Step Matters

Successful AI initiatives require a **clear understanding of the current operational process**.

By mapping the workflow baseline, you will be able to:

- identify high-value automation opportunities
- design more realistic AI solutions
- anticipate operational risks
- create stronger AI transformation proposals
